

# **PlaySpray New & Improved**

## **What's new about PlaySpray?**

- The VOC% has changed in the formula. VOC was 80%, is now 55%.

## **What does VOC% mean?**

VOC ( Volatile Organic Compound) are compounds commonly found in cleaning, painting, and personal care products. The VOC% represents the level of alcohol in a formula. These compounds can also function as propellants that drive the product out of the canister.

High VOC levels in products are of concern to the Environmental Protection Agency because of the impact they have on the atmosphere and ozone layer. Over the past several years an increasing number of states have passed restrictions on allowable VOC levels in products and these restrictions are expected to be nationwide in a matter of a few years.

## **What improvements have we made to the formula by changing the VOC levels?**

- It is environmentally friendly and better of the ozone/atmosphere.
- With a lower alcohol level, it is healthier for hair.

## **Will you notice a difference in performance?**

With less alcohol, the product will be slightly wetter coming out of the can. You should allow a slightly longer dry time.
